Flashing (programming) control units

- To flash the AGW, Sound, KI and UCP systems, select the "Program to factory data" menu item.

- At this time, system diagnosis in W211 is automatically programmed as part of the exchange function when placing the control unit in service.

- To flash the ME2.8 engine control unit, select the "Program control unit (with SDFlash Release CD)" menu item.

- In the 2nd quarter of 2003, the "Program to factory data" function will be completely replaced by the SDFlash Release CD.

- In the future, control units will be set up and configured through prompt-driven flashing and coding.

Note: For buses, the "Automatic parameterisation" menu item will allow you to properly configure many types of exchange control units. In addition, you will be able to download software for FPS and DMUX control units. For tour buses, the required data will be available in an individual vehicle CD (stored near the diagnostic plug). For city buses, you will have to request a CD from the flashware department at customer service.
